

Introduction to The Endpoint Section

09/01/2024 8:17 am EST

As of the time of the time of writing, there are currently 135 different stats that this package can access from [The NBA Website](#).[□]

Each endpoint gives information about the data it returns, parameters that the endpoint takes and sample results.

Tip

To get all the arguments that an endpoint can return, use `.expected_data.keys()`

Example

```
from nba_api.stats.endpoints import commonplayerinfo
doncic_data = commonplayerinfo.CommonPlayerInfo(1629029)
doncic_data.expected_data.keys()
```

This returns all the arguments the `commonplayerinfo` endpoint can take.

```
dict_keys(['AvailableSeasons', 'CommonPlayerInfo', 'PlayerHeadlineStats'])
```
